

Debug the Note taking Application

Bugs Found and their Solutions:

1. The application was not working because in the route it have methods="POST" and in HTML that method is not mentioned.

A. Solved by putting method="POST" in html and added if condition in app.py

2. Whenever I am refreshing the application due to get method by default it is taking previous text value from the list.

A. To avoid this I put "required" in html form tag, used method="POST" instead of method="GET" and also I used redirect(url) to avoid auto updation of data when I refresh the page.
